

## Health care in South Asia

### Health Care in Contemporary India: Economic Growth and Social Development

1<sup>st</sup> year student

Cameroon Field School

Research Area: India, Nepal

Shin EGISHI

Key words: Health care, South Asia, Diversity, Sustainability, Economic growth

#### Background and objectives of my research

My research aims to analyze health care issues in South Asia. Dysfunction of the body due to illness causes loss of worker's productivity, crisis of reproduction in the region and weakening the community. Therefore, to ensure good health for people is a vital element in search of sustainable humanosphere. The 2008 G 8 Summit, along with provisions on individual disease, pointed out that governments and institutions needed to develop effective measures to strengthen regional health care systems.

South Asian countries are ranked low-class group according to western development index. However there are lessons we can learn from South Asia regarding health care policy, given its experience with developing policy in the face of diversity of ethnicity, language and religion.

India, in particular, has been experienced remarkable economic growth in recent years; hereafter it is considered that India will face transitional phase in social development. With its vast land and social complexity, how will Indian society realize good health care in future? We can learn a lot regarding qualitative social development by observing how India tries to develop its health care policy from now on.
